

Python cheatsheet (the basics)

Interact with the user (*input and output*)

Print a message

```
print('Hello, world!')
```

Print multiple values (of different types)

```
ndays = 365  
print(f'There are {ndays} days in a year')
```

Asking the user for a string

```
name = input('What is your name? ')
```

Asking the user for a whole number (an integer)

```
num = int(input('Enter a number: '))
```

Decide between options

Decide to run a block (or not)

```
x = 3  
if x == 3:  
    print('x is 3')
```

Decide between two blocks

```
mark = 80  
if mark >= 50:  
    print('pass')  
else:  
    print('fail')
```

Decide between many blocks

```
mark = 80  
if mark >= 65:  
    print('credit')  
elif mark >= 50:  
    print('pass')  
else:  
    print('fail')
```

- ▶ `elif` can be used without `else`
- ▶ `elif` can be used many times

Are two values equal?

```
x == 3
```

⚠ two equals signs, not one

Are two values not equal?

```
x != 3
```

Less than another?

```
x < 3
```

Greater than another?

```
x > 3
```

Less than or equal to?

```
x <= 3
```

Greater than or equal to?

```
x >= 3
```

The answer is a *Boolean*:

```
True or False
```

String manipulation

Compare two strings

```
msg = 'hello'  
if msg == 'hello':  
    print('howdy')
```

Less than another string?

```
if msg < 'n':  
    print('a-m')  
else:  
    print('n-z')
```

⚠ strings are compared character at a time (*lexicographic order*)

Is a character in a string?

```
'e' in msg
```

Is a string in another string?

```
'ell' in msg
```

Change string case

```
msg = 'hEllo'  
msg.upper()  
msg.lower()  
msg.title()
```

Count a character in a string

```
msg.count('l')
```

Replace a character or string

```
msg.replace('l', 'X')
```

Delete a character or string

```
msg.replace('l', '')
```

Check string case

```
msg.isupper()  
msg.islower()  
msg.istitle()
```

Text (*strings*)

Single quoted

```
'perfect'
```

Double quoted

```
"credit"
```

Multi-line

```
'''Hello,  
World!'''
```

Add (*concatenate*) strings

```
'Hello' + 'World'
```

Multiply string by integer

```
'Echo...' * 4
```

Length of a string

```
len('Hello')
```

Convert string to integer

```
int('365')
```

Variables

Creating a variable

```
temp_in_c = 25
```

Using a variable

```
temp_in_c * 9/5 + 32
```

Whole numbers (*integers*)

Addition and subtraction

```
365 + 1 - 2
```

Multiplication and division

```
25 * 9/5 + 32
```

Powers (*2 to the power of 8*)

```
2 ** 8
```

Convert integer to string

```
str(365)
```

Repeat a block (a fixed number of times)

Repeat a block 10 times

```
for i in range(10):  
    print(i)
```

Sum the numbers 0 to 9

```
total = 0  
for i in range(10):  
    total = total + i  
print(total)
```

Repeat a block over a string

```
for c in 'Hello':  
    print(c)
```

Keep printing on one line

```
for c in 'Hello':  
    print(c, end=' ')  
print('!')
```

Repeat a block over list (or string) indices

```
msg = 'I grok Python!'  
for i in range(len(msg)):  
    print(i, msg[i])
```

Count from 0 to 9

```
range(10)
```

⚠ range starts from 0 and goes up to, but not including, 10

Count from 1 to 10

```
range(1, 11)
```

Count from 10 down to 1

```
range(10, 0, -1)
```

Count 2 at a time to 10

```
range(0, 11, 2)
```

Count down 2 at a time

```
range(10, 0, -2)
```

Putting it together: Celsius to Fahrenheit converter

Ask the user for a temperature in degrees Celsius

```
temp_in_c = int(input('Temp. in Celsius? '))
```

Calculate the conversion

```
temp_in_f = temp_in_c * 9/5 + 32
```

Output the result

```
print(f'{temp_in_f} Fahrenheit')
```
